This course is aimed at those new to programming and provides an introduction to programming using Python. This course is probably unsuitable for those with programming experience, even if it is just in shell scripting or Matlab-likie programs. Such individuals should try the "Python: Introduction for Programmers" course instead. By the end of this course, attendees should be able to write simple Python programs and to understand more complex Python programs written by others.

These lectures are designed to give students a gentle introduction to applied mathematics in their first term at Oxford, allowing time for both students and tutors to work on developing and polishing the skills necessary for the course. It will have an `A-level' feel to it, helping in the transition from school to university.

These notes serve as course notes for an undergraduate course in number theory. Most if not all universities worldwide offer introductory courses in number theory for math majors and in many cases as an elective course. The notes contain a useful introduction to important topics that need to be addressed in a course in number theory. Proofs of basic theorems are presented in an interesting and comprehensive way that can be read and understood even by non-majors with the exception in the last three chapters where a background in analysis, measure theory and abstract algebra is required. The

exercises are carefully chosen to broaden the understanding of the concepts. Moreover, these notes shed light on analytic number theory, a subject that is rarely seen or approached by undergraduate students. One of the unique characteristics of these notes is the careful choice of topics and its importance in the theory of numbers. The freedom is given in the last two chapters because of the advanced nature of the topics that are presented.

Excerpt from An Introductory Course of Quantitative Chemical Analysis: With Explanatory Notes and Stoichiometrical Problems It has been found expedient with large classes to allow the whole class to work simultaneously upon the same procedure (for example, that for the determination of chlorine in sodium chlo ride), since classroom instruction can then

be made more effective. Each individual is, however, permitted to work as rapidly as his capacity admits; and to such students as exhibit unusual facility in manipulation extra analyses are assigned.
