Oracle 11g Release 2 (11gR2) continues the trend toward automated database performance tuning tools that started in Oracle 10g. However, tuning the performance of an Oracle 11gR2 database is still just as much of an art as it is a science. This article - the first in this series - provides a primer that focuses on one of the most challenging arenas of database performance tuning: the detection and analysis of performance bottlenecks within the database's underlying input/output (I/O) subsystem.

I/O Performance Tuning Tools for Oracle Database 11gR2. By Jim Czuprynski. Oracle Database 11g Release 2 (11gR2) makes it easier than ever to isolate and identify potential root causes of poor I/O performance. This article focuses on the various Oracle and non-Oracle tools to generate sample workloads to provide sufficient metrics for detection and eventual resolution of performance bottlenecks within the database ' s underlying input/output (I/O) subsystem.

In addition, because Oracle Database is a high-performance database management system that effectively uses resources of your Windows computer, it should not also serve as any of the following: Primary or backup domain controller. File or print server. Remote access server. Router. These configurations consume network, memory, and CPU resources.

For general database tuning information, see Tuning Database Parameters. Oracle Identity Manager has many configuration options. The best way to identify bottlenecks and optimize performance is to monitor key database performance indicators in your production environment and adjust the configuration accordingly.

In Oracle 11g there is now the ability to create a second layer of buffer cache called the Database Smart Flash Cache, which is used as an overflow for the buffer cache. The Database Smart Flash Cache resides on SSD disks that are available to the OS. As data gets aged off of the buffer cache, it is written into the Database Smart Flash Cache.

UnOptimized Reads in Oracle Database 11gR2 - Performance ...

Synopsis: Even though today's enterprise storage system technology has dramatically reduced the impact of I/O performance problems, it's not impossible that an Oracle 11gR2 database could be affected by insufficient I/O bandwidth or latency. Oracle 11g Release 2 (11gR2) makes it easier than ever to isolate and identify potential root causes of poor I/O performance.

I recommend Bert Scalzo's book "Oracle Utilities" for a full discussion of export performance tuning, and these tips for using the export query clause. Use a parallel export - You can [parallelize your export to degree cpu_count-1, but it is important to remember to also split to dmp file so that expdp can write to multiple files at the same time.
