The goal is to give an up to date introduction to the technology behind these laser systems and to the broad range of intense laser applications. These applications include AMO (atomic molecular and optical) physics, x-ray science, attosecond science, plasma physics and particle acceleration, condensed matter science and laser micromachining, and finally even high-energy physics.

The rapid development of powerful pulsed lasers is at the origin of a
considerable interest in studying the response of an atom, a molecule
(or a solid) to a strong electromagnetic field. It is now possible to
produce at the laboratory scale, ultra-short 13 pulses with a duration of
100 femtoseconds (10⁻¹³ second) and a power of the order 12 of 1
terawatt (10¹² Watt).

In this updated edition, the chapter on laser-driven atoms is augmented by the discussion of two-electron atoms interacting with strong and short laser pulses, as well as by a review of ATI rings and low energy structures in photo-electron spectra. In the chapter on laser-driven molecules a discussion of 2D infrared spectroscopy is incorporated.
